

The `showkeys` package*

David Carlisle Morten Høgholm

2007/08/07

1 Introduction

`sec:intro`

`showkeys.sty` modifies the `\label`, `\ref`, `\pageref`, `\cite`, and `\bibitem` commands so that the ‘internal’ key is printed. The package tries hard to position these labels so that the formatting of the rest of the document is unchanged. `\label` and `\bibitem` cause the key to appear in a box either in the margin, or in a `TEX` box of zero width, which may possibly over-print other text. The `\ref`, `\pageref` and `\cite` commands print their arguments in small type, raised just above the line, like this: `\ref{sec:intro}`. This package works with the `fleqn` option, the packages in the AMS-L^AT_EX collection, and the `variorref`, `natbib` and `harvard` packages.

2 Package Options

`options`

Some people have commented that the printing of the `\ref` and `\cite` keys is less useful than the printing of the `\label` keys and so `showkeys` now supports two options that can be given in the `\usepackage` command:

notref to stop the redefinition of `\ref` and `\pageref`, and related commands from the `variorref` package.

notcite to stop the redefinition of `\cite` and related commands from the `harvard` and `natbib` packages.

So if the package is loaded with `\usepackage[notref]{showkeys}` then `\ref` will have its standard definition, but `\label` will print its key argument (usually in the margin).

If you find the printed keys distracting, but don’t want to use the above options to stop them altogether you may use:

color Print the keys in a distinguishing colour. The default value is a light grey.

The colours may be changed by redefining the following two colours after the package is loaded. `refkey` (also used for `\cite`) and `labelkey` (also used for `\bibitem`). The defaults are:

```
\definecolor{refkey}{gray}{.75}
\definecolor{labelkey}{gray}{.75}
```

If this option is used the `color` package will be loaded.

The package accepts two further options.

final to suppress the action of this package, for ‘final’ versions.

draft the normal behaviour of this package.

*This file has version number v3.15, last revised 2007/08/07.

Clearly there is not much point in entering the `final` option directly in the `\usepackage` command, as just not loading this package would have the same effect, and execute more quickly, however the `final` option may be useful as it may be used once in the `documentclass` command to affect any number of packages that may be loaded. The `draft` option does not do anything, but is there to honour an informal convention that packages have these options in pairs.

You can also control the appearance of the typeset label with the command `\showkeyslabelformat`, which takes one argument. The default is

```
\providecommand*\showkeyslabelformat[1]{%
  \fbox{\normalfont\small\ttfamily#1}}
```

The command is called inside a group so you can put in local modifications of `\fboxsep`, for instance, without them leaking to the rest of the document.

3 More Examples

`examples`

The only other similar package that I could find in the macro index, [\[3\]](#), was [anon:sk](#) [showlabels.sty](#), [\[1\]](#). After the first draft of this package was written, I found [\[2\]](#) [anon:sk](#) on my local installation! I think the current package is more robust than [\[2\]](#), but I thought that `showkeys` was rather a good name, so I have stolen it for this file.

- `e^1` 1. This has `\label` immediately after `\item`.
- `e^2` 2. This has the `\label` at the end.

A minipage :-

<code>m&e^1</code> <code>m&e^2</code>	Within environments like this <code>minipage</code> , we cannot use <code>\marginpar</code> ¹ , so the appearance is slightly different. Here is that <code>enumerate</code> environment again: 1. This has <code>\label</code> immediately after <code>\item</code> . 2. This has the <code>\label</code> at the end.
--	---

Displayed math (without `equation` counter).

$$0 = 0 \boxed{\text{disp}}$$

Some text referring to the maths on page [2](#), and the item [e^1](#).

If `showkeys` thinks that the current environment is going to produce an “equation number”, then it does not show the label where the `\label` command occurs, but tries to put it in the margin, as shown with equation [1](#). The package ‘knows’ about the standard `equation` and `eqnarray` environments, and also all the numbered alignment environments offered by the `AMSLaTeX` package, `amsmath`.

$$1 = 1 \tag{1} \boxed{\text{eq:xx}}$$

$$\begin{array}{rcl} 2 & = & 2 \\ 3 & = & 3 \\ 4 & = & 4 \end{array} \tag{2} \boxed{\text{eqnar:a}}$$

$$\tag{3} \boxed{\text{eqnar:b}}$$

¹Actually `\marginpar` is not used at all in this package now.

Within a `figure` environment, the `\label` must not come before the `\caption` command. If you place `\label` inside the argument of `\caption` the label will be shown like this:

Figure 1: Within the caption argument. cap:a

If you place `\label` immediately after the `\caption` command it will be shown like this:

Figure 2: Immediately after the caption argument. cap:b

If you place the `\label` command at some random point after the `\caption` command, it may be shown like:

Figure 3: In vertical mode not immediately after a box.

cap:c

References

- GN:s1 [1] Gil Neiger, *showlabels.sty*, Undated package, similar to this one, but shows labels inline, affecting the formating of the document.
- anon:sk [2] Annonymous, *showkeys.sty*, Package, dated 14 May 1988. Very similar to this one, also uses `\marginpar` in outer vertical mode.

4 The Macros

1 `(*package)`

First we handle the options. Normally all related commands are defined to show their ‘keys’. But since v3.03 one can specify:

`notref` to stop the redefinition of `\ref` (and `\pageref`, and related commands from `variorref` package),

`notcite` to stop the redefinition of `\cite` and related commands from the `harvard` and `natbib` packages.

2 `\DeclareOption{notref}{\let\SK@ref\empty}`
 3 `\DeclareOption{notcite}{\let\SK@cite\empty}`

`\SK@refcolor` Colour commands. Normally no-op.

4 `\let\SK@refcolor\relax`
 5 `\let\SK@labelcolor\relax`

`color` option loads the `color` package and defines the colours. Delayed to the end of the package as package loading not allowed in this option section.

6 `\DeclareOption{color}{\AtEndOfPackage{%`
 7 `\RequirePackage{color}}%`
 8 `\definecolor{refkey}{gray}{.75}%`
 9 `\definecolor{labelkey}{gray}{.75}%`
 10 `\def\SK@refcolor{\color{refkey}}}}`
 11 `\def\SK@labelcolor{\color{labelkey}}}}`

Allow `final` to be specified in the document class options to supress the loading of this package.

12 `\DeclareOption{final}{%`
 13 `\providecommand*\showkeyslabelformat[1]{}}`
 14 `\endinput}`
 15 `\DeclareOption{draft}{}`
 16 `\ProcessOptions`

```

\SK@label The saved original definitions
\SK@bibitem 17 \let\SK@label\label
\SK@lbibitem 18 \let\SK@bibitem\@bibitem
              19 \let\SK@lbibitem\@lbibitem

\label The new definition, print the argument, and then do the old definition.
      20 \def\label#1{%
      21   \bphack
      22   \SK@\SK@@label{#1}%
      23   \begingroup
      24     \SK@label{#1}%
      25   \endgroup
      26   \espHack}

\@bibitem For \bibitem, position the showkeys code as for a standard list with \item and \label.
\@lbibitem
      27 \def\@bibitem#1{%
      28   \SK@bibitem{#1}\SK@\SK@@label{#1}\ignorespaces}
      29 \def\@lbibitem[#1]#2{%
      30   \SK@lbibitem[{#1}]{#2}\SK@\SK@@label{#2}\ignorespaces}

\SK@ Grab hold of #2 via \meaning so characters like & and ^ do not cause problems
      later, and pass the result on to the command #1.
      31 \def\SK@#1#2{%
      32   \protected@edef\@tempa{#2}%
      33   \expandafter#1\meaning\@tempa\SK@}

\showkeyslabelformat
      34 \providecommand*\showkeyslabelformat[1]{%
      35   \fbox{\normalfont\small\ttfamily#1} }

\SK@@label Strip off the initial segment of the \meaning output, and then put the rest either
      in a \marginpar or in a box of size 0pt, hopefully not disturbing the surrounding
      text.
      36 \def\SK@@label#1>#2\SK@{%
Need to work globally as in some cases like alignments, and fleqn, the counter
      will be printed in a different group to the \label command.
      37 \gdef\SK@lab{\smash{\SK@labelcolor\showkeyslabelformat{#2}}}{%
      38 \ifvmode
      39   \if@inlabel

If the \label is straight after \item (\bibitem is handled by this case as well)
      then the item label has not been added to the page yet. It is hanging around in
      the box \@labels waiting for the paragraph to start. So just need to attach the
      label to this box.
      40 \global\setbox\@labels\hbox{%
      41   \llap{\SK@lab\SK@lab@relax
      42     \kern\@totalleftmargin\kern\marginparsep}%
      43   \box\@labels}%
      44 \else

If we insert a box into the main vertical list, do not want to change \prevdepth
      as that would affect vertical spacing in the document. (The box itself should not
      cause any difference in break points as there is a node there anyway coming from
      the \write to the aux file.
      45 \dimen@\prevdepth
      46 \nointerlineskip

```

The inner vertical mode cases are mainly designed to do the right thing with float captions, but seem to work OK in other cases as well.

```
47      \ifinner
48          \skip@\\lastskip\\unskip
```

In inner vertical mode, attach the label to the right of the immediately preceding box, if it is a box before the current point. Otherwise just put it in a box of zero dimensions, with no interline skip. (This may slightly move the surrounding text (but perhaps not now that `\prevdepth` is restored.)

```
49      \\advance\\skip@\\lastskip\\unskip
50      \\setbox\\z@\\lastbox
51      \\ifvoid\\z@
52          \\llap{\\SK@lab\\SK@lab@relax\\kern\\marginparsep}%
53      \\else
54          \\hbox{\\box\\z@\\rlap{\\kern\\marginparsep\\SK@labx}}%
55      \\fi
56      \\vskip\\skip@
57      \\else
```

In outer vertical mode, previously used a `\vadjust` at the start of the next paragraph (and before that used `\marginpar`). These methods sometimes cause extra space, eg if paragraph starts with a math display, so now just insert the box directly, taking care not to change `\prevdepth`.

```
58      \\llap{\\SK@lab\\SK@lab@relax\\kern\\marginparsep}%
59      \\fi
```

Restore `\prevdepth`.

```
60      \\prevdepth\\dimen@
61      \\fi
62  \\else
```

If we are in an numbered equation-style environment, do nothing as the code to print the number will also print the label, otherwise just stick the label at the current point, in a box of zero dimensions.

```
63      \\csname SK@\\currenvir\\endcsname
64      \\ifSK@equation\\else
65          \\ifmmode
66              \\SK@labx
67      \\else
```

Inner horizontal mode. Not much we can do, just stick it here.

```
68      \\ifinner
69          \\rlap{\\SK@lab}
70      \\else
```

In outer horizontal mode use `\vadjust` to get to the margin.

```
71      \\vadjust{\\llap{\\SK@lab\\kern\\marginparsep}}%
72      \\fi
73      \\SK@lab@relax
74      \\fi
75      \\fi
76  \\fi}
```

`\tagform@` Firstly we grab `\@eqnnum`.
`\@eqnnum` 77 `\AtBeginDocument{%`
`\maketag@@@` 78 `\let\\SK@eqnnum\\@eqnnum`

Then check for `amsmath` where we grab the internal commands `\tagform@` and `\maketag@@@`. Redefine them and redefine `\@eqnnum` as well.

```
79  \\@ifpackageloaded{amsmath}{%
80      \\let\\SK@tagform@\\tagform@
81      \\let\\SK@maketag@@@\\maketag@@@
82      \\iftagsleft@
```

```

83      \def\tagform@#1{%
84          \ifx\df@label\empty
85              \SK@lab@relax
86          \else
87              \expandafter\SK@label\meaning\df@label\SK@
88          \fi
89          \llap{\SK@lab\kern\marginparsep}%
90          \SK@lab@relax\SK@tagform@{#1}}%
91      \def\maketag@@@#1{%
92          \ifx\df@label\empty
93              \SK@lab@relax
94          \else
95              \expandafter\SK@label\meaning\df@label\SK@
96          \fi
97          \llap{\SK@lab\kern\marginparsep}\SK@lab@relax
98          \SK@maketag@@@{#1}}%
99      }%
100     \def\@eqnnum{%
101         \llap{\SK@lab\kern\displaywidth\kern\marginparsep}%
102         \SK@lab@relax\SK@eqnnum}%
103     \else

```

Almost the same for tags on the right, except we use `\rlap` and typeset it after the tag.

```

104      \def\tagform@#1{%
105          \ifx\df@label\empty
106              \SK@lab@relax
107          \else
108              \expandafter\SK@label\meaning\df@label\SK@
109          \fi
110          \SK@tagform@{#1}%
111          \rlap{\kern\marginparsep\SK@lab}\SK@lab@relax}%
112      \def\maketag@@@#1{%
113          \ifx\df@label\empty
114              \SK@lab@relax
115          \else
116              \expandafter\SK@label\meaning\df@label\SK@
117          \fi
118          \SK@maketag@@@{#1}%
119          \rlap{\kern\marginparsep\SK@lab}\SK@lab@relax
120      }%
121      \def\@eqnnum{\SK@eqnnum\rlap{\kern\marginparsep\SK@lab}%
122          \SK@lab@relax}%
123      \fi
124  }%

```

If `amsmath` wasn't loaded we check explicitly if the `leqno` option was used in `\documentclass` and redefine accordingly.

```

125  {%
126      \@ifundefined{ver@leqno.clo}{%
127          \def\@eqnnum{\SK@eqnnum\rlap{\kern\marginparsep\SK@lab}%
128              \SK@lab@relax}%
129      }{%
130          \def\@eqnnum{%
131              \llap{\SK@lab\kern\displaywidth\kern\marginparsep}%
132              \SK@lab@relax\SK@eqnnum}%
133      }%
134  }%
135 }

```

`\SK@labx` Print the label, and then globally reset the print command to `\relax`.

```
136 \def\SK@labx{\rlap\SK@lab\global\let\SK@lab\relax}
```

\SK@lab@relax	Clear the label.
	137 \def\SK@lab@relax{\global\let\SK@lab\relax}\SK@lab@relax
\SK@equation	The following environments print an equation number, so \label should not print its argument at the point where it appears. Note this will fail to show the label if you are in an eqnarray environment, and use \label together with \nonumber This might just about make sense if you are going to use \pageref, but that is too bad...
	138 \newif\ifSK@equation
	139 \let\SK@equation\SK@equationtrue
	140 \let\SK@eqnarray\SK@equationtrue
\eqnarray	When the AMS packages are loaded showkeys assumes environments work ‘The AMS way’ However eqnarray (unlike equation) is not redefined, so here we need to remove some of the AMS hacks.
	141 \toks@\expandafter{\eqnarray}
	142 \edef\eqnarray{\let\noexpand\tagform@\noexpand\SK@tagform@\the\toks@}
\SK@align	The AMS environments
\SK@alignat	143 \let\SK@align\SK@equationtrue
