

The `hopatch` package

Heiko Oberdiek

<heiko.oberdiek at googlemail.com>

2011/06/24 v1.1

Abstract

This packages provides a wrapper to various package hooks provided by other packages or classes, but does not define own hooks.

1 Documentation

Sometimes I want to add code right after a package has been loaded. Examples are bug fixes, adaptations, or added features as needed by package `hyperref`, for instance.

Unhappily L^AT_EX does not provide this kind of hook. `\AtEndOfPackage` can be used inside the package only, because L^AT_EX clears the hook right before it loads the package.

However, there are already many packages and classes that provide hooks that are executed after the package is loaded, see table 1.

Table 1: After package hooking

Macro	Provider
\AfterPackage	package <code>scrlfile</code> [5]
\AtEndOfPackageFile	package <code>filehook</code> [2]
\AtEndPackage	class <code>memoir</code> [4]

Table 2: After begin document hooking

Macro	Provider
\AtBeginDocument	LATEX's kernel
\AtEndPreamble	package <code>etoolbox</code> [1]
\AfterEndPreamble	package <code>etoolbox</code>

Package `hopatch` can be used without the packages of table 1. But for an early executing right after a package is loaded, one of the following class or packages should be loaded before using \hopatch@AfterPackage:

- package `filehook`
- package `scrlfile`
- class `memoir`

Therefore I skip writing a new package for hooking into LATEX's package management and use this package to provide a wrapper to patch a package after it is loaded.

`\hopatch@AfterPackage {<package>} {<patch code>}`

If the package is already loaded, the `<patch code>` is executed immediately. Otherwise the `<patch code>` is stored in a command and tried at later locations until the package is available.

The patch is tried in the following order:

1. If the package is already loaded, the patch is applied immediately. Further locations are not tried.
2. \AtEndPackage, provided by class `memoir` [4], and \AfterPackage, provided by package `scrlfile` [5], are called right after the package file is input before the hook of LATEX's \AtEndOfPackage.
3. \AtEndOfPackageFile, provided by package `filehook` [2], is called after the package is loaded and after the hook of LATEX's \AtEndOfPackage.
4. \AtEndPreamble, provided by package `etoolbox` [1], is called at the beginning of \begin{document} before the hook of LATEX's \AtBeginDocument.
5. \AtBeginDocument, provided by LATEX.
6. \AfterEndDocument, provided by package `etoolbox` [1], is called at the very end of \begin{document}. Preamble commands are already forbidden there.

Because of the various locations the patch code is restricted to limitations:

- Preamble commands, see LATEX's \onlypreamble throw an error if used after \begin{document}. This is already the case for \AfterEndDocument. Therefore preamble commands are forbidden in the patching code. There are four exceptions \ifpackageloaded, \ifclassloaded, \ifpackagelater and \ifclasslater. They are redefined during \AfterEndDocument using the counterparts of package `ltxcmds` [3].

- `\AfterPackage` of package `scrlfile` and `\AtEndPackage` of class `memoir` call the hook before L^AT_EX's `\AtEndOfPackage`.

2 Implementation

4 Installation

4.1 Download

Package. This package is available on CTAN¹:

CTAN:macros/latex/contrib/oberdiek/hopatch.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/hopatch.pdf Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN:install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard “A Directory Structure for TeX Files” (CTAN:tds/tds.pdf). Directories with `texmf` in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory `TDSScripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain TeX:

```
tex hopatch.dtx
```

¹[ftp://ftp.ctan.org/tex-archive/](http://ftp.ctan.org/tex-archive/)

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
hopatch.sty           → tex/latex/oberdiek/hopatch.sty
hopatch.pdf          → doc/latex/oberdiek/hopatch.pdf
test/hopatch-test1.tex → doc/latex/oberdiek/test/hopatch-test1.tex
test/hopatch-test2.tex → doc/latex/oberdiek/test/hopatch-test2.tex
hopatch.dtx          → source/latex/oberdiek/hopatch.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your \TeX distribution (`teTeX`, `mikTeX`, ...) relies on file name databases, you must refresh these. For example, `teTeX` users run `texhash` or `mktexlsr`.

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk hopatch.pdf unpack_files output .
```

Unpacking with L^AT_EX. The `.dtx` chooses its action depending on the format:

plain \TeX : Run `docstrip` and extract the files.

L^AT_EX: Generate the documentation.

If you insist on using L^AT_EX for `docstrip` (really, `docstrip` does not need L^AT_EX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{hopatch.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL^AT_EX:

```
pdflatex hopatch.dtx
makeindex -s gind.ist hopatch.idx
pdflatex hopatch.dtx
makeindex -s gind.ist hopatch.idx
pdflatex hopatch.dtx
```

5 Catalogue

The following XML file can be used as source for the [TeX Catalogue](#). The elements `caption` and `description` are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is `hopatch.xml`.
