

The `selinput` package

Heiko Oberdiek
<heiko.oberdiek at googlemail.com>

2007/09/09 v1.2

Abstract

This package selects the input encoding by specifying between input characters and their glyph names.

1 Documentation

1.1 Introduction

L^AT_EX supports the direct use of 8-bit characters by means of package `inputenc`. However you must know and specify the encoding, e.g.:

```
\documentclass{article}
\usepackage[latin1]{inputenc}
% or \usepackage[utf8]{inputenc}
% or \usepackage[??]{inputenc}
```

```
\begin{document}
    Umlauts: ÄÖÜäöüß
\end{document}
```

If the document is transferred in an environment that uses a different encoding, then there are programs that convert the input characters. Examples for conversion of file `test.tex` from encoding latin1 (ISO-8859-1) to UTF-8:

```
recode ISO-8859-1..UTF-8 test.tex
recode latin1..utf8 test.tex
iconv --from-code ISO-8859-1
    --to-code UTF-8
    --output testnew.tex
    test.tex
iconv -f latin1 -t utf8 -o testnew.tex test.tex
```

However, the encoding name for package `inputenc` must be changed:

```
\usepackage[latin1]{inputenc} → \usepackage[utf8]{inputenc}
```

Of course, unless you are using some clever editor that knows package `inputenc`, recodes the file and adjusts the option at the same time. But most editors can perhaps recode the file, but they let the option untouched.

Therefore package `selinput` chooses another way for specifying the input encoding. The encoding name is not needed at all. Some 8-bit characters are identified by their glyph name and the package chooses an appropriate encoding, example:

```
\documentclass{article}
\usepackage{selinput}
\SelectInputMappings{
    adieresis={ä},
    germandbls={ß},
    Euro={€},
}
\begin{document}
    Umlauts: ÄÖÜäöüß
\end{document}
```

1.2 User interface

```
\SelectInputEncodingList {\langle encoding list\rangle}
```

`\SelectInputEncodingList` expects a comma separated list of encoding names.
Example:

```
\SelectInputEncodingList{utf8,ansinew,mac-roman}
```

The encodings of package `inputenx` are used as default.

```
\SelectInputMappings {\langle mapping pairs\rangle}
```

A mapping pair consists of a glyph name and its input character:

```
\SelectInputMappings{
    adieresis={ä},
    germandbls={ß},
    Euro={€},
}
```

The supported glyph names can be found in file `ix-name.def` of project `inputenx` [1]. The names are basically taken from Adobe's glyphlists [2, 3]. As many pairs are needed as necessary to identify the encoding. Example with insufficient pairs:

```
\SelectInputEncodingSet{latin1,latin9}
\SelectInputMappings{
    adieresis={ä},
    germandbls={ß},
}
Umlauts: ÄÖÜäöüß and Euro: € (wrong)
```

The first encoding `latin1` passes the constraints given by the mapping pairs. However the Euro symbol is not part of the encoding. Thus a mapping pair with the Euro symbol solves the problem. In fact the symbol alone already succeeds in selecting between `latin1` and `latin9`:

```
\SelectInputEncodingSet{latin1,latin9}
\SelectInputMappings{
    Euro={€},
}
Umlauts: ÄÖÜäöüß and Euro: €
```

1.3 Options

warning: The selected encoding is written by `\PackageInfo` into the `.log` file only. Option `warning` changes it to `\PackageWarning`. Then the selected encoding is shown on the terminal as well.

ucs: The encoding file `utf8x` of package `\ucs` requires that the package itself is loaded before. If the package is not loaded, then the option `ucs` will load package `\ucs` if the detected encoding is UTF-8 (limited to the preamble, packages cannot be loaded later).

utf8=...: The option allows to specify other encoding files for UTF-8 than L^AT_EX's `utf8.def`. For example, `utf8=utf-8` will load `utf-8.def` instead.

1.4 Encodings

Package `stringenc` [4] is used for testing the encoding. Thus the encoding name must be known by this package. Then the found encoding is loaded by `\inputencoding` by package `inputenc` or `\InputEncoding` if package `inputenx` is loaded.

The supported encodings are present in the encoding list, thus usually the encoding names do not matter. If the list is set by `\SelectInputEncodingList`, then you can use the names that work for package `inputenc` and are known by package `stringenc`, for example: `latin1, x-iso-8859-1`. Encoding file names of package `inputenx` are prefixed with `x-`. The prefix can be dropped, if package `inputenx` is loaded.

2 Implementation

```
1 {*package}
2 \NeedsTeXFormat{LaTeX2e}

4 Installation

4.1 Download

Package. This package is available on CTAN¹:

CTAN:macros/latex/contrib/oberdiek/selinput.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/selinput.pdf Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN:install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard “A Directory Structure for T_EX Files” (CTAN:tds/tds.pdf). Directories with `texmf` in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

¹[ftp://ftp.ctan.org/tex-archive/](http://ftp.ctan.org/tex-archive/)

Script installation. Check the directory `TD\$:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain `\TeX`:

```
tex selinput.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

<code>selinput.sty</code>	→ <code>tex/latex/oberdiek/selinput.sty</code>
<code>selinput.pdf</code>	→ <code>doc/latex/oberdiek/selinput.pdf</code>
<code>test/selinput-test1.tex</code>	→ <code>doc/latex/oberdiek/test/selinput-test1.tex</code>
<code>test/selinput-test2.tex</code>	→ <code>doc/latex/oberdiek/test/selinput-test2.tex</code>
<code>test/selinput-test3.tex</code>	→ <code>doc/latex/oberdiek/test/selinput-test3.tex</code>
<code>test/selinput-test4.tex</code>	→ <code>doc/latex/oberdiek/test/selinput-test4.tex</code>
<code>test/selinput-test5.tex</code>	→ <code>doc/latex/oberdiek/test/selinput-test5.tex</code>
<code>selinput.dtx</code>	→ <code>source/latex/oberdiek/selinput.dtx</code>

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your `\TeX` distribution (`teTeX`, `mikTeX`, ...) relies on file name databases, you must refresh these. For example, `teTeX` users run `texhash` or `mktexlsr`.

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk selinput.pdf unpack_files output .
```

Unpacking with L^AT_EX. The `.dtx` chooses its action depending on the format:

plain `\TeX`: Run `docstrip` and extract the files.

L^AT_EX: Generate the documentation.

If you insist on using L^AT_EX for `docstrip` (really, `docstrip` does not need L^AT_EX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{selinput.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL^AT_EX:

```
pdflatex selinput.dtx
makeindex -s gind.ist selinput.idx
pdflatex selinput.dtx
makeindex -s gind.ist selinput.idx
pdflatex selinput.dtx
```

5 Catalogue

The following XML file can be used as source for the L^AT_EX Catalogue. The elements `caption` and `description` are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is `selinput.xml`.

```

7 History

[2007/06/16 v1.0]

- First version.

[2007/06/20 v1.1]

- Requested date for package stringenc fixed.

[2007/09/09 v1.2]

- Line end fixed.
